

NURSE-N-GLOW™ meets North America's most stringent safety standards.

As doctors and as parents, our first concern is children's safety, health and well-being.

NURSE-N-GLOW™ has been product safety tested to meet the most stringent safety criteria, including the latest flammability standards. The pillow has been tested under the rigorous CSA C/US designation of "Non Prescription Medical Device". This CSA certification permits Canadian distribution and puts in place much of the ground work for expansion into European markets as it dovetails well with CE (European) safety standards.

The pillow is made of polyurethane foam and meets or exceeds California flammability safety standards. The NURSE-N-GLOW™ pillow is free of PBDE's, fire retardant chemicals suspected of contributing to learning disorders and hyperactivity in children.

Developed by Chiropractors, NURSE-N-GLOW™ supports the infant's spine in a neutral position. The side lying infant's neck and spine can rotate in opposite directions when unsupported. This may result in a condition known as spinal subluxation (nerve irritation from misaligned vertebrae).

The Journal of the American Medical Association has found that subluxation of C2, the second vertebral segment of the spine, is evident in 98% of all SIDS (Sudden Infant Death Syndrome) cases. The inventors, both Chiropractors, immediately realized the structural implications recumbent breast feeding has on a child's spine and came up with their patented design addressing these concerns. The side lying position also reduces the likely hood of aspiration should the baby spit up when nursing.
